Tarrasy-style fortifications

Tarassy-style fortifications
A wooden log wall built in the *tarassy* style. This was a style of building in wood common in Russia in the 15th and 16th centuries. *Tarassy* were wooden cells joined together by overlapping longitudinal logs. The cells could be rectangular, trapezoidal or triangular in shape. The *tarassy* were often filled up with earth or small stones. Wooden walls of this type could withstand artillery fire as well as those made of stone. This plate also shows an intra-rampart wooden structure.

THE ROBOT AND THE PC CAN BE FRIENDS

Linking domestic robots to PCs could provide many benefits. An office worker, for example, could keep tabs on the security of his home, the cleaning of his floors, the folding of his laundry, and the care of his bedridden mother by monitoring a network of household robots on his desktop PC. The machines could communicate wirelessly with one another and with a home PC.
